In addition to a higher incidence and prevalence of primary ocular disease and systemic diseases associated with ocular disease in older compared to younger adults, older adults also experience normal age-related changes in vision. Because symptoms may be relatively mild or progress slowly, older adults may be unaware of or underreport impaired visual acuity. Older adults may also have difficulty recognizing or reporting impaired visual acuity due to the presence of co-morbidities such as cognitive impairment. Screening for vision disorders could help identify impaired visual acuity in older adults and lead to treatments that improve quality of life or functional capacity, or prevent or slow down progression of vision loss. In 2008, the U. S. Preventive Services Task Force commissioned an evidence review on screening for impaired visual acuity in older adults, in order to inform an updated USPSTF guideline. The main purpose of the evidence review is to evaluate new evidence published on screening for impaired visual acuity in older adults. Impaired visual acuity refers to decreased clarity or sharpness of vision....
